Essential Matrix Estimation

Assumption: Identical pin hole cameras.

Task: Recover Euclidean transformation between two cameras.

Epipolar Constraint

- Camera centers $C_1, C_2 \in \mathbb{R}^3$.
- Attached frames $F_1 = \{e_1, e_2, e_3\}$ and $F_2 = \{e'_1, e'_2, e'_3\}$.
- Euclidean transformation $(R, t) : F_1 \mapsto F_2$.

n

• Let $M_i = [X_i, Y_i, Z_i]^{\top}$, i = 1, 2 denote coords. of M w.r.t. F_i . Then

$$M_1=RM_2+t.$$

• Camera image points (pixel coords) $m_i = [u_i, v_i, 1]^{\top}$. Then

$$p_1^{\top} \hat{t} Rm_2 = 0$$
 (Epipolar Constraint)

• Essential matrix $E := \hat{t}R$, with R orthonormal, det R = 1 and skew-symmetric $\hat{t} = -\hat{t}^{\top}$ with ||t|| = 1.

Facts: The set of essential matrices \mathcal{E} is

a compact connected 5-dimensional manifold diffeomorphic to

$$\mathbb{RP}^2 \times SO_3 \cong \left\{ E \in \mathbb{R}^{3 \times 3} | E = U \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix} V^\top; U, V \in SO_3 \right\},$$

(an orbit! "SVD action"),

- NOT a vector space,
- NOT easily described by equality constraints without redundancy,
- NOT diffeomorphic to the product of Stiefel manifolds $S^2 \times SO_3$.
- a reductive homogeneous space diffeomorphic to $SO_3 \times SO_3/O_2$

200

不同 トイモトイモト

Task: Given a set of *N* point correspondences $(m_i, m'_i)_{i=1}^N$, estimate *E* encapsulating the relative pose.

Ideas:

- In the noise free case every pair has to fullfil the epipolar constraint m[⊤]_it̂Rm'_i = 0.
- Choose suitable cost to be minimised over *E*. Simplest choice (least squares) is

$$f: \mathcal{E} \to \mathbb{R}, \quad E \mapsto \sum_{i=1}^{N} (m_i^{\top} E m_i')^2.$$

- Global minimisation of f over E.
- Choose suitable family of parameterisations for ${\cal E}$ (dim ${\cal E}=5$).

イロトイポトイラトイラト・ラ

Fact: The tangent space at the essential matrix $E = UE_0 V^{\top}$ is

$$T_{E}\mathcal{E} = \left\{ U(\Omega E_{0} - E_{0}\Psi)V^{\top} \middle| \Omega, \Psi \in \mathfrak{so}_{3} \right\}$$
$$= \left\{ U \begin{bmatrix} 0 & \omega_{12} - \psi_{12} & -\psi_{13} \\ \psi_{12} - \omega_{12} & 0 & -\psi_{23} \\ -\omega_{13} & -\omega_{23} & 0 \end{bmatrix} V^{\top} \middle| \omega_{ij}, \psi_{ij} \in \mathbb{R}, i, j \in \{1, 2, 3\} \right\}$$

with $\Omega = (\omega_{ij})$ and $\Psi = (\psi_{ij})$.

Sac

Useful Parameterisations for \mathcal{E}

Let
$$E_0 := \begin{bmatrix} 1 & 1 \\ & 0 \end{bmatrix}$$
 and

$$\Omega_1(x) = \begin{bmatrix} 0 & -x_3 & x_2 \\ x_3 & 0 & -x_1 \\ -x_2 & x_1 & 0 \end{bmatrix}, \quad \Omega_2(x) = \begin{bmatrix} 0 & x_3 & x_5 \\ -x_3 & 0 & -x_4 \\ -x_5 & x_4 & 0 \end{bmatrix}.$$

$$\mu_{(U,V)}^{exp} : \mathbb{R}^5 \to \mathcal{E}, \quad x \mapsto U e^{\Omega_1(x)} E_0 e^{-\Omega_2(x)} V^{\top},$$

$$\mu_{(U,V)}^{GS} : \mathbb{R}^5 \to \mathcal{E}, \quad x \mapsto U (I + \Omega_1(x))_{GS} E_0 (I - \Omega_2(x))_{GS} V^{\top},$$

$$\mu_{(U,V)}^{SVD} : \mathbb{R}^5 \to \mathcal{E}, \quad x \mapsto U (E_0 + \Omega_1(x)E_0 - E_0\Omega_2(x))_{SVD} V^{\top}.$$
Gram-Schmidt:
Let $X = QR$ unique QR-dec of invertible X . Then $X_{GS} := Q$.

SVD: Let $X = \hat{U}\Sigma\hat{V}^{\top}$ ordered SVD, then $X_{\text{SVD}} := \hat{U}E_0\hat{V}^{\top}$.

Sac

Algorithm

Let

$$\mu: \mathcal{E} \times \mathbb{R}^5 \to \mathcal{E}, \quad \mu(E, 0) = \mu_{(U, V)}(0) = E.$$

With the gradient of $f \circ \mu_{(U,V)}$ at 0

 $\nabla_{f\circ\mu(E,\cdot)}(0),$

and the Hessian of $f \circ \mu_{(U,V)}$ at 0

 $H_{f\circ\mu(E,\cdot)}(0).$

The algorithmic map to be iterated is then:

$$\begin{split} s: \mathcal{E} &\to \mathcal{E}, \\ s(E) &= \mu \left(E, -(H_{f \circ \mu(E, \cdot)}(0))^{-1} \cdot \nabla_{f \circ \mu(E, \cdot)}(0) \right) \end{split}$$

Some details (we might discuss off-line)

- Why are our algorithms well defined? As there exist orthogonal $U_1 \neq U_2$ and $V_1 \neq V_2$ with $\mu_{(U_1,V_1)} = \mu_{(U_2,V_2)}$.
- Why is \mathcal{E} not globally diffeomorphic to a product of Stiefel manifolds? Any consequences?
- Are our algorithms intrinsic Newton methods, i.e. can we find a corresponding Riemannian metric?

Stereo Matching

Two coplanar cameras observe a planar patch.

Task: Recover Euclidean transformation between two cameras.

Applications in Computer Vision

3

Sar

・ 同 ト ・ ヨ ト ・ ヨ ト

Stereo Matching

Assumption: Two sets of image points $\{X_{1,i}\}$, and $\{X_{2,i}\}$, $X_{1,i}, X_{2,i} \in \mathbb{R}^3$ are unordered, i.e. the pointwise correspondence between both sets is unknown. The only available information then is the Euclidian displacement (R, τ) , $R \in SO_3$ and $\tau \in \mathbb{R}^3$ between the cameras.

Typical tasks:

(i) recover the geometry of the observed patch from the two images,

(ii) establish a pointwise correspondence of both sets of image points,

(iii) find a homographic transformation from the points of one image to the points of the other.

Idea (Zhou/Ghosh CDC 1996): From normalized image points form the Gramians $N, Q \in \mathbb{R}^{n \times n}$

$$N = \frac{1}{k} \sum_{i=1}^{k} X_{1,i} X_{1,i}^{\top}, \quad Q = \frac{1}{k} \sum_{i=1}^{k} X_{2,i} X_{2,i}^{\top},$$

and find a transformation *A* via following a gradient flow which minimises the cost $||Q - ANA^{\top}||^2$.

Questions:

- What kind of transformations are the A matrices?
- What is the structure of the set of critical points?
- Can one do better than following a gradient flow?
- Are there closed form solutions available in the noise free case?

イロト 不得 トイヨト イヨト ニヨー

Fact:

The set of A-matrices forms a noncompact 3-dim. Lie group

$$G = \left\{ \left. l_3 + e_1 a^\top \in \mathbb{R}^{3 \times 3} \right| 1 + e_1^\top a > 0, a \in \mathbb{R}^3 \right\}.$$

with Lie algebra

$$\mathfrak{g} := \left\{ \left. e_1 b^\top \right| b \in \mathbb{R}^3
ight\}$$

and Lie bracket the matrix commutator.

- 周ト - ヨト - ヨト

Parameterization:

By exponentiating Lie algebra elements we obtain for any $A \in G$ the parameterization map

$$u : \mathbb{R}^3 \to G, \quad \nu(b) := \exp(e_1 b^\top) = I_3 + h(e_1^\top b)e_1 b^\top$$
(1)

with

$$h(b_1) = \begin{cases} \frac{e^{b_1} - 1}{b_1} & b_1 \neq 0\\ & & \\ 1 & b_1 = 0 \end{cases}$$
(2)

Note that ν satisfies $\nu(0) = I_3$ and ν defines a global diffeomorphism onto the group *G*.

< ロ > < 同 > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

For convenience:

Lemma

Given an $(n \times n)$ -matrix $N = N^{\top} > 0$ and let $M = \{ANA^{\top} | A \in G\}$. Then M is a smooth and connected 3-dimensional manifold. The map

$$\phi: \boldsymbol{G}
ightarrow \boldsymbol{M}, \quad \phi(\boldsymbol{A}) := \boldsymbol{A} \boldsymbol{N} \boldsymbol{A}^{ op}$$

is a global diffeomorphism. The tangent space of M at $X \in M$ is $T_X M = \{BX + XB^\top | B \in \mathfrak{g}\}$

Correspondingly, we obtain a family of global parameterizations of the manifold M as

$$\mu_X : \mathbb{R}^3 \to M, \quad \mu_X(b) := e^{e_1 b^\top} X(e^{e_1 b^\top})^\top.$$

Thus μ_X satisfies $\mu_X(0) = X$ and μ_X defines a global diffeomorphism onto the manifold M.

Lemma

Let $N = N^{\top}$ be positive definite. The function $f: M \to \mathbb{R}, \quad f(X) = ||Q - X||^2$ with $f(X) = ||Q - X||^2$ has a unique critical point $X_c \in M$. The critical point X_c is characterized by the property that the first column coincides with that of Q.

Idea:

Minimise f over M via Newton-on-manifold approach to find the unique global minimum.

イロト イポト イヨト イヨト 二三

$$\nabla (f \circ \mu_X)(0) = 4X(X - Q)e_1,$$

$$\mathsf{H}_{f \circ \mu_X}(0) = 4(X^2 + Xe_1e_1^\top X + e_1^\top (X - Q)e_1X)$$

$$+ \frac{1}{2}(X(X - Q)e_1e_1^\top + e_1e_1^\top (X - Q)X)).$$

Note that the Hessian at the unique critical point X_c simplifies to

$$\mathsf{H}_{f \circ \mu_{X_c}}(0) = 4 \left(X_c^2 + X_c e_1 e_1^\top X_c \right)$$

K. Hüper (MPI Tübingen & Univ. Würzburg) Applications in Computer Vision

3

Sac

イロト イポト イヨト イヨト

Iterate the map

$$s: M \to M.$$

Let $x^{opt}(X)$ denote the solution of

$$\widehat{\mathsf{H}}_{f\circ\mu_X}(\mathsf{0})\, x = -
abla(f\circ\mu_X)(\mathsf{0}),$$

where for any $X \in M$

$$\widehat{\mathsf{H}}_{f\circ\mu_X}(0) = 4\left(X^2 + Xe_1e_1^\top X\right).$$

Thus

$$x^{\text{opt}}(X) = X^{-1}(I_n - \frac{1}{2}e_1e_1^{\top})(Q - X)e_1$$

is well-defined for any $X \in M$. The algorithmic map *s* is given as

$$s(X) = \mu_X \left(x^{\mathsf{opt}}(X) \right).$$

Sac

イロト 不得 トイヨト イヨト 二三

Lemma

The algorithm $s(X) = \mu_X (x^{opt}(X))$ converges locally quadratically fast.

Proof:

The mapping is smooth. The first derivative of the mapping at the critical point is equal to zero.

Alternative Approach: Cholesky Factorisation

Unique Cholesky factors

$$N = U_N U_N^{ op}, \quad Q = U_Q U_Q^{ op}$$

with upper triangular matrices U_N , U_Q with positive diagonal entries. Thus for group elements

$$A(x_1, x_2, x_3) = \begin{bmatrix} x_1 & x_2 & x_3 \\ 1 & 1 \end{bmatrix}$$
(3)

we introduce

$$\widetilde{f} \colon \mathbb{R}^3 \to \mathbb{R},$$

 $\widetilde{f}(x_1, x_2, x_3) := \|A(x_1, x_2, x_3)U_N - U_Q\|^2$

to be minimized. The function \tilde{f} is convex and its gradient and Hessian can be easily computed.

K. Hüper (MPI Tübingen & Univ. Würzburg)

Applications in Computer Vision

Grenoble 18/9/08 24 / 29

Alternative Approach: Cholesky Factorisation

$$U_{N} = \begin{bmatrix} a & b & c \\ 0 & d & e \\ 0 & 0 & g \end{bmatrix}, \quad U_{Q} = \begin{bmatrix} r & s & t \\ 0 & u & v \\ 0 & 0 & w \end{bmatrix}.$$
$$\nabla \widetilde{f}(x, y, z) = 2U_{N}(A(x, y, z)U_{N} - U_{Q})^{\top}e_{1}$$
$$H_{\widetilde{f}(x, y, z)} = 2U_{N}U_{N}^{\top} = 2N = 2\begin{bmatrix} a^{2}+b^{2}+c^{2} & bd+ce & cg \\ bd+ce & d^{2}+e^{2} & eg \\ cg & eg & g^{2} \end{bmatrix}.$$

Clearly, $H_{\tilde{f}(x,y,z)} \succ 0$. A Newton iteration step for this problem then moves right into the minimum

$$\begin{bmatrix} x_{t+1} \\ y_{t+1} \\ z_{t+1} \end{bmatrix} = \begin{bmatrix} x_t \\ y_t \\ z_t \end{bmatrix} - \mathbf{H}_{\widetilde{f}(x_t, y_t, z_t)}^{-1} \nabla \widetilde{f}(x_t, y_t, z_t) = \begin{bmatrix} \frac{t}{a} \\ \frac{as-rb}{ad} \\ \frac{adt-cdr-aes+ber}{adq} \end{bmatrix}.$$
 (4)

K. Hüper (MPI Tübingen & Univ. Würzburg)

イロト 不得 トイヨト イヨト 三日

Thus, $A(x, y, z) \in G$ with

$$x = \frac{r}{a}, \ y = \frac{as-rb}{ad}, \ z = \frac{adt-cdr-aes+ber}{adg}$$

is the unique group element minimizing f. In the noise free case at the minimum

$$d=u, e=v, g=w,$$

 $AU_N = U_Q$ and therefore the minimal value is equal to zero.
